

d Quarterly cost roundup

Approved For Release 2002/05/09 : CIA-RDP86-00244R000300020026-4

Parameter costs help compare buildings

parameter costs are more meaningful measures for comparing building costs than total square foot or cube costs.

The latter are generally misleading when used for cost comparisons. None of these cost comparison tools is simple, however, that it adjusts for differences in building shapes, finishes, or usual foundation conditions.

The parameter cost system is superior because it relates the cost of each standard trade to the physical measure (parameter) of the building that is the chief determinant of that trade.

The table below provides parameter

costs and the percentage breakdown of where the building dollar went for three buildings completed between December, 1969, and March, 1970.

The court house in Port Washington, Wis., and the Atlanta office building demonstrate how parameter costs disclose big differentials, which may reflect the owner's preference or unusual costs. The office had 50% more air conditioning tonnage, but lower heating requirements, yet its HVAC cost half as much per square foot of finished area. It had more plumbing fixtures, yet the owner spent half as much for plumb-

ing. By contrast, the owner spent much more for its curtain wall (precast concrete) and glass than the court house.

Building costs reported here are supplied to ENR by leading contractors, all members of ENR's 400 largest contractors in 1969: Holder Construction Co., Atlanta, Joseph P. Jansen Co., Milwaukee, and Leonard Shaffer Associates, Philadelphia.

Previous building parameter cost reports appeared in the ENR cost reports for 12/15/66, 3/16/67, 6/20/68, 12/19/68, 3/20/69, 6/19/69, 9/18/69 and 3/19/70.
